## **Involved Region or Country**

**Condition** 

North America, Uzbekistan, Russia, Middle East, Israel, Palestine, Colombia, Ecuador, Paraguay, Japan, Singapore, Philippines, Other Africa Some customers may comment that the MIL is illuminated.

Some technicians may find one or more of the following DTCs set in the Engine Control Module (ECM).

• - P0172: Fuel Trim System

### Cause

### **Correction**

### Rich Bank 1

• - P0175: Fuel Trim System Rich Bank 2

This condition may be caused by a possible high pressure fuel pump. If SI does not isolate the cause of the rich condition, the following information may be helpful:

- 1. 1. Disconnect the dirty air side of the PCV system.
- 2. 2. Plug the vacuum supply.
- 3. 3. Start the engine and monitor the fuel trims in closed loop.
  - If the fuel trims
    return to normal, this is
    a good indicator that
    the high pressure fuel
    pump is leaking.

With this concern, we do not see a lot of fuel in the crankcase, so changing the oil may not isolate the concern.

When the high pressure fuel pump leaks, the PCV will pull the fuel mist straight into the intake, causing the concern.

Version Modified 1 Released September 25, 2020
