*Involved Region or Country*

North America, Argentina, Brazil, Chile, Guatemala, Peru, Europe, Israel, Middle East, China, Japan, Philippines, Thailand, Cadillac Korea, GM Korea Company

*Condition*

Some customers may comment that the vehicle may rock or move slightly forward or rearward while in Park at start up and/or when using the remote vehicle start function.

- This condition may be accompanied by a clunk noise.

*Cause*

This condition may be caused by the application of the 1-2-7-8 Reverse Clutch and the 1-2-3-4-5 Reverse Clutch in addition to residual transmission fluid in the other clutch packs creating a partial apply on start up.

- The movement may be more apparent at Ignition On, during a remote vehicle start.

As the 1-2-7-8 Reverse Clutch and the 1-2-3-4-5 Reverse Clutch are applied at Ignition On, the engine and portions of the transmission are at full idle speed causing the clutches to apply at a quicker rate than during a normal start. This movement is stopped by the park pawl and/or the transmission fluid exhausting completely from the clutch packs.

*Correction*

This condition is normal and no repairs should be attempted. This can be verified by comparing with another identically built vehicle under the same conditions.

## Parts Information

No parts are required for this repair.

*Version*

2

*Modified*

Released September 21, 2018

January 22, 2021 – Added the 2020-2021 Model Years, additional Models and updated the Involved Region or Country section.
